Bed Bug Treatments**

## Introduction to bed bug treatments

Our bed bug treatment consists of a first and second treatment. Why the second treatment you ask? Bed bug eggs hatch in 7-10 days, therefore we wouldn't want you to have to deal with any leftover bugs. Once we are finished treating the unit the tenant must remain out for 4 hours. In preparation for a treatment the tenant needs to:

- Empty night tables
- Empty all dressers
- Put clothes and linens in garbage bags(which will be provided two days before treatment)
- Pull all furniture six inches away from the walls

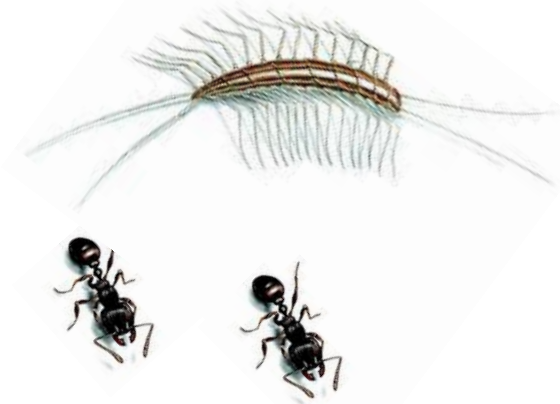

## Emerald Pest Control

### Full Preparation and Treatment

A full prep and treat consists of vacuuming, steaming and a pesticide application. We will vacuum your furniture, beds and baseboards to remove eggs, live and dead bugs. Then we steam the furniture, beds and baseboards and anywhere else there is live activity or eggs present. Last but not least is the pesticide application where we will apply a residual insecticide to furniture, beds, baseboards, door frames and bathroom. There will also be a dust applied to all electrical outlets and other applicable areas.

### Pesticide Application only

A pesticide application consists of a technician coming in and treating all the furniture, door frames, baseboards and bathroom with a residual insecticide. We also remove faceplates in order to dust and dust any gaps along the baseboards.

### Other Pest Control Services:

- Rodent control
- Wildlife control
- Ants
- Silverfish
- Bees
